FARM SUCCESSION ATLAS

Evidence that leads back to the original service

An independent public directory for people taking over, transferring or starting a farm in Europe.

Farm Succession Atlas brings together land and holding banks, succession and matching services, establishment support, training, advice, official portals and policy frameworks. It does not replace their authorities or operators: every record sends the reader to the original service.

Why it exists

Useful routes are fragmented across European, national, regional and local administrations, land agencies, chambers, cooperatives and other operators. Existence and availability are different: a legal framework, an announced service and an open application window must not be presented as the same thing.

The 2026 edition

325 records	**101** territorial files	**525** distinct source pages
1,666 literal quotations	**739** research leads	**579** reusable queries

Scope: the European layer plus Spain, France, Germany, Italy and Portugal. The edition records 271 active, 41 unknown, 11 announced and 2 historical entries. Coverage is not a quota: a documented absence remains a result.

What makes the account auditable

- Every factual claim carries a public HTTPS source, the date it was read and the literal words that support it.
- Stable identifiers keep records comparable; research briefs preserve what each pass searched, rejected and left unresolved.
- Deterministic validation checks schemas, territorial inheritance, evidence, figures, dates and the trace from every record to an admitted lead.
- Live checks revisit cited pages and distinguish a confirmed match from a changed page or a page that could not be read automatically.
- The frozen edition has a published SHA-256 manifest and a retrieval and verification guide.

INSTITUTIONAL USE

A practical layer over existing public services

The Atlas is designed to make authoritative routes easier to find, cite and correct without becoming another operator.

Direct people

Link to a territorial or record page as a neutral starting point; the original operator remains the destination.

Reuse data

Cite or analyse one frozen edition rather than an undocumented copy of the live site.

Audit gaps

See which instruments were found, rejected or left unresolved because a current access route was not readable.

Correct claims

Supply the official page and exact sentence that changed; the public correction route requires no account.

Where collaboration helps

The most useful contribution is not endorsement or a general directory link. It is a canonical current page that states what a person can use, where it applies, how to access it and, when relevant, the application period.

1. Point to the authoritative page for a concrete service or programme.
2. Confirm whether an older or announced route is operating.
3. Identify a moved source while preserving the claim it supports.
4. Report a missing territorial route with its public evidence.
5. Reuse and cite the frozen edition with attribution.

No institution is asked to approve the whole corpus, lend its name to the project, share personal data or maintain a duplicate feed. A contribution changes nothing automatically: it is read, recorded and checked under the same rules as every other source.

Boundaries by design

- No eligibility decisions, applications or advice on an individual case.
- No inference that a programme is open today from an old call or a legal basis.
- No claim that an automated reading is human review.
- No cookies, analytics, browser storage or third-party request on the static public site.
- No automatic publication; merging research or code does not publish the site.
- No country expansion without complete data, research, territorial structure and language support.
